What is Linux?

Linux is an open source operating system kernel. It was created in the year 1991 by Linus Torvalds.

What is Open Source?

In an open-source project, the source code is made public, so that anyone can access it and can modify it based on their requirement.

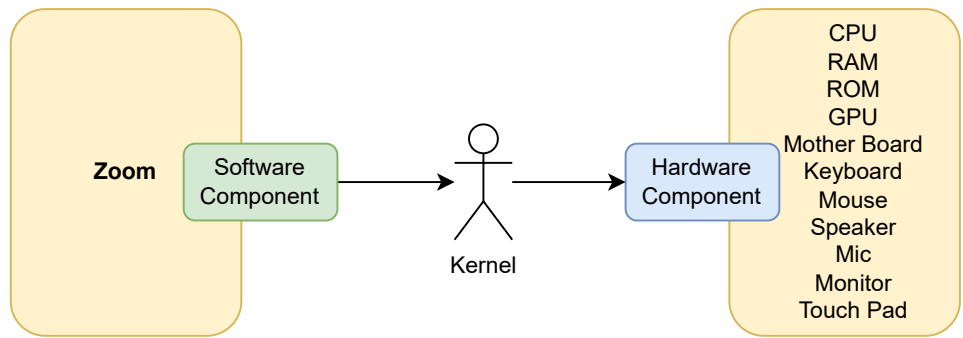

Features of Linux OS?

In an open-source project, the source code is made public, so that anyone can access it and can modify it based on their requirement

| | | |
|-----------------|--------------------|----------------|
| Cost Effective | Secure | Open Source |
| Easily Modify | Light Weight | Stable |
| Fast Processing | Multi user support | Good Community |

What is Kernel?

A Linux kernel is a computer program which is the core component that connects the hardware components to the software component. It acts as bridge between these two components. It is also known as heart of an operating system.
